

Surveys and Databases

Eduardo González-Solares (IoA, Cambridge, UK)

Challenges in Modern Astrophysics, Sofia 13 -14 October 2009

Why Survey The Sky?

- A survey is the observation of large volumes of the universe in order to gather representative samples of objects, to discover new types of objects and/or to find the most rare objects
- Scientific aims of surveys are very broad
- Wide versus Deep

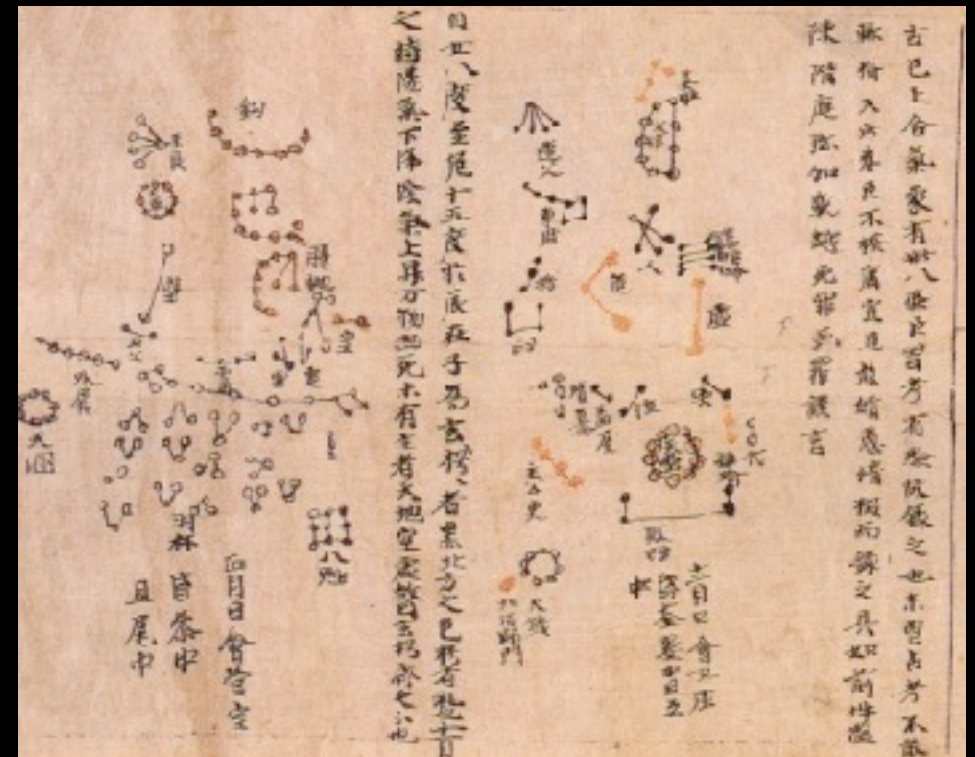

Surveys : A brief history

Ancient Surveys

- At night one can see about ~1000 stars
- First sky surveys were records of positions and motions of stars and planets over **5,000 years ago** (Egypt, China, Central America, Mesopotamia)
- First star catalogue (800 stars) created in China in **350 B.C.**
- Greek philosophers (**600 B.C to 400 A.D**):
 - Movement and distance of planets
 - Size of Earth, Sun and Moon

Modern Astronomy

- Nicholas Copernicus (1543) solar system movement
- 1600s movement of planets
 - Tycho Brahe & Kepler compiled accurate astronomical catalogue of 700 stars
 - Galileo Galilei invents the telescope -> we can see further than our eye
 - Isaac Newton gravitation theory

20th Century Surveys

- Invention of camera and spectrograph (late 1800s)
- Schmidt telescope (46 cm) in Mount Palomar (1936)
- Palomar Sky Survey I (1950-57) using a 1.2 meter telescope in Palomar, followed by Palomar Sky Survey II (1980-99)
- Development of observatories and surveys at other wavelengths (radio: FIRST, X-ray: RASS, Infrared: 2MASS, Far-IR: IRAS)

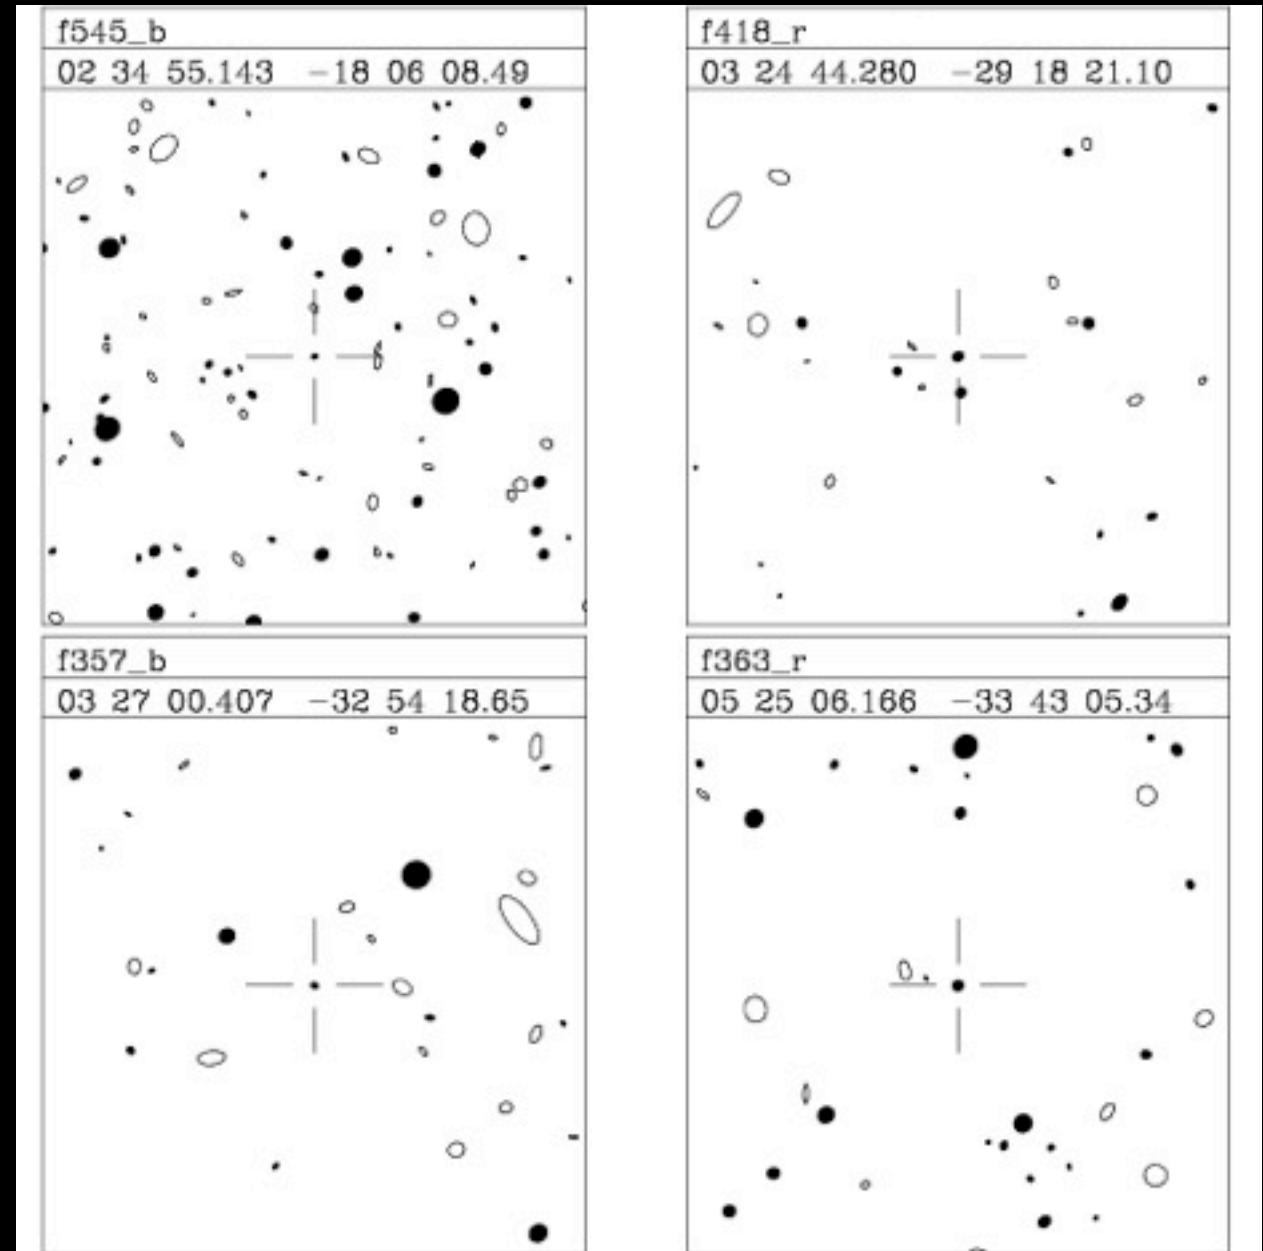

A bit of history

Automate Plate Measurement machine,
IoA, Cambridge

The APM photographic sky survey

- ~10GB/day
- ~1000 plates/year
- UKST, AAT, KPNO, CFHT, CTIO
- Object extraction and parameterization
- ~4h/plate scanning and processing (UKST)

McMahon & Irwin 1992
Irwin 1994
McMahon et al 2001

Modern day technology

1st light CCD on 1m telescope in KPNO (1979)

VIRCAM@VISTA

Omegacam@VST

Modern Day Surveys

Optical: The Sloan Digital Sky Survey

- **SDSS** 2.5m telescope at Apache Point Observatory (New Mexico)
- Optical multiband (ugriz) imaging and spectroscopic survey of 1/4 of the sky
- Imaging catalogue: 357M / Spectroscopic catalogue: 1.6M
- Archive > 100 TB

SDSS-I: 2000-5
SDSS-II: 2005-8
SDSS-III: 2008-14

Optical: The Sloan Digital Sky Survey

- Discovery of most distant quasars seen when the Universe was just 900 million years old
- Measurement of large scale structure of galaxies
- Origin and structure of the Milky Way

Near-IR: From 2MASS to VISTA

- Near-IR is more sensitive to cooler, redder stars than optical
- Can view through dust regions
- Probe red, obscured galaxies
- **2MASS** covers all sky
- 4M images, 472M objects
- 10TB of images

Near-IR: From 2MASS to VISTA

- **UKIDSS** now observing 7,500 sq deg - 3 mag deeper than 2MASS
- Coolest and nearest brown dwarfs
- High-z starburst galaxies
- Galaxy clusters at $z \sim 2$
- High-z quasars at $z \sim 7$

Near-IR: From 2MASS to VISTA

- UKIDS
- sq de
- 2MAS
- Cooler dwarf
- High-
- Galax
- High-

Near-IR: From 2MASS to VISTA

- **UKIDSS** now observing 7,500 sq deg - 3 mag deeper than 2MASS
- Coolest and nearest brown dwarfs
- High-z starburst galaxies
- Galaxy clusters at $z \sim 2$
- High-z quasars at $z \sim 7$

2.5 sq. deg. 2MASS vs UKIDSS-DXS

Near-IR: From 2MASS to VISTA

- **VISTA** will survey the southern hemisphere in the near-IR
- Nearest and lowest mass stars
- Nature and evolution of Dark Energy
- Physics of the epoch of reionization; the discovery of the first $z > 7$ QSOs
- 100 times the volume of 2MASS
- Support of ESA missions: XMM-Newton, Herschel, Planck, GAIA

Mid- and Far-IR: IRAS, Spitzer and Herschel

- **IRAS** (1983) full sky survey at 12, 25, 60 and 100 μm - 350,000 sources
 - Infrared cirrus (dust clouds in our galaxy)
 - Starburst galaxies - galaxies emit most of the bolometric luminosity in the IR
 - Strong IR emission from interacting galaxies
 - Most luminous object in the Universe (F10214+4724)

Mid- and Far-IR: IRAS, Spitzer and Herschel

- **Spitzer** (2003, still operating) and **Herschel** (2009) are observatory type missions but much time is dedicated so surveys.
- Very cool stars
- History of Star Formation and energy production
- Galaxy structure formation, evolution of clustering
- AGN/Starburst Connection

Herschel Key Projects

Herschel Multi-tiered Extragalactic Survey (HerMES, 900hrs)

PACS Evolutionary Probe (PEP, 650hrs)

The Herschel Thousand Degree Survey (600hrs)

The Great Observatories Origins Deep Survey: far-infrared imaging with Herschel (363hrs)

The Herschel Lensing Survey (292h)

X-Ray, Radio, Sub-mm,

- X-Ray: RASS, XMM and Chandra Surveys, ...
- Radio: FIRST VLA Survey, ...
- CMB: COBE, WMAP, Planck, ...
- GAIA will produce the most accurate 3D map of our Galaxy

Every telescope or space mission
has been used to carry out surveys
... and also pushed to their limits to
reach the most distant Universe ...

Deep Surveys : Hubble Ultra Deep Field

- 1 million seconds
- 11 sq arcmin / 38M pixels
- 10,000 galaxies many at $z > 3$
- To observe the entire sky would take 1 million years
- Target of all major observatories: Chandra, XMM, Spitzer, VLA,

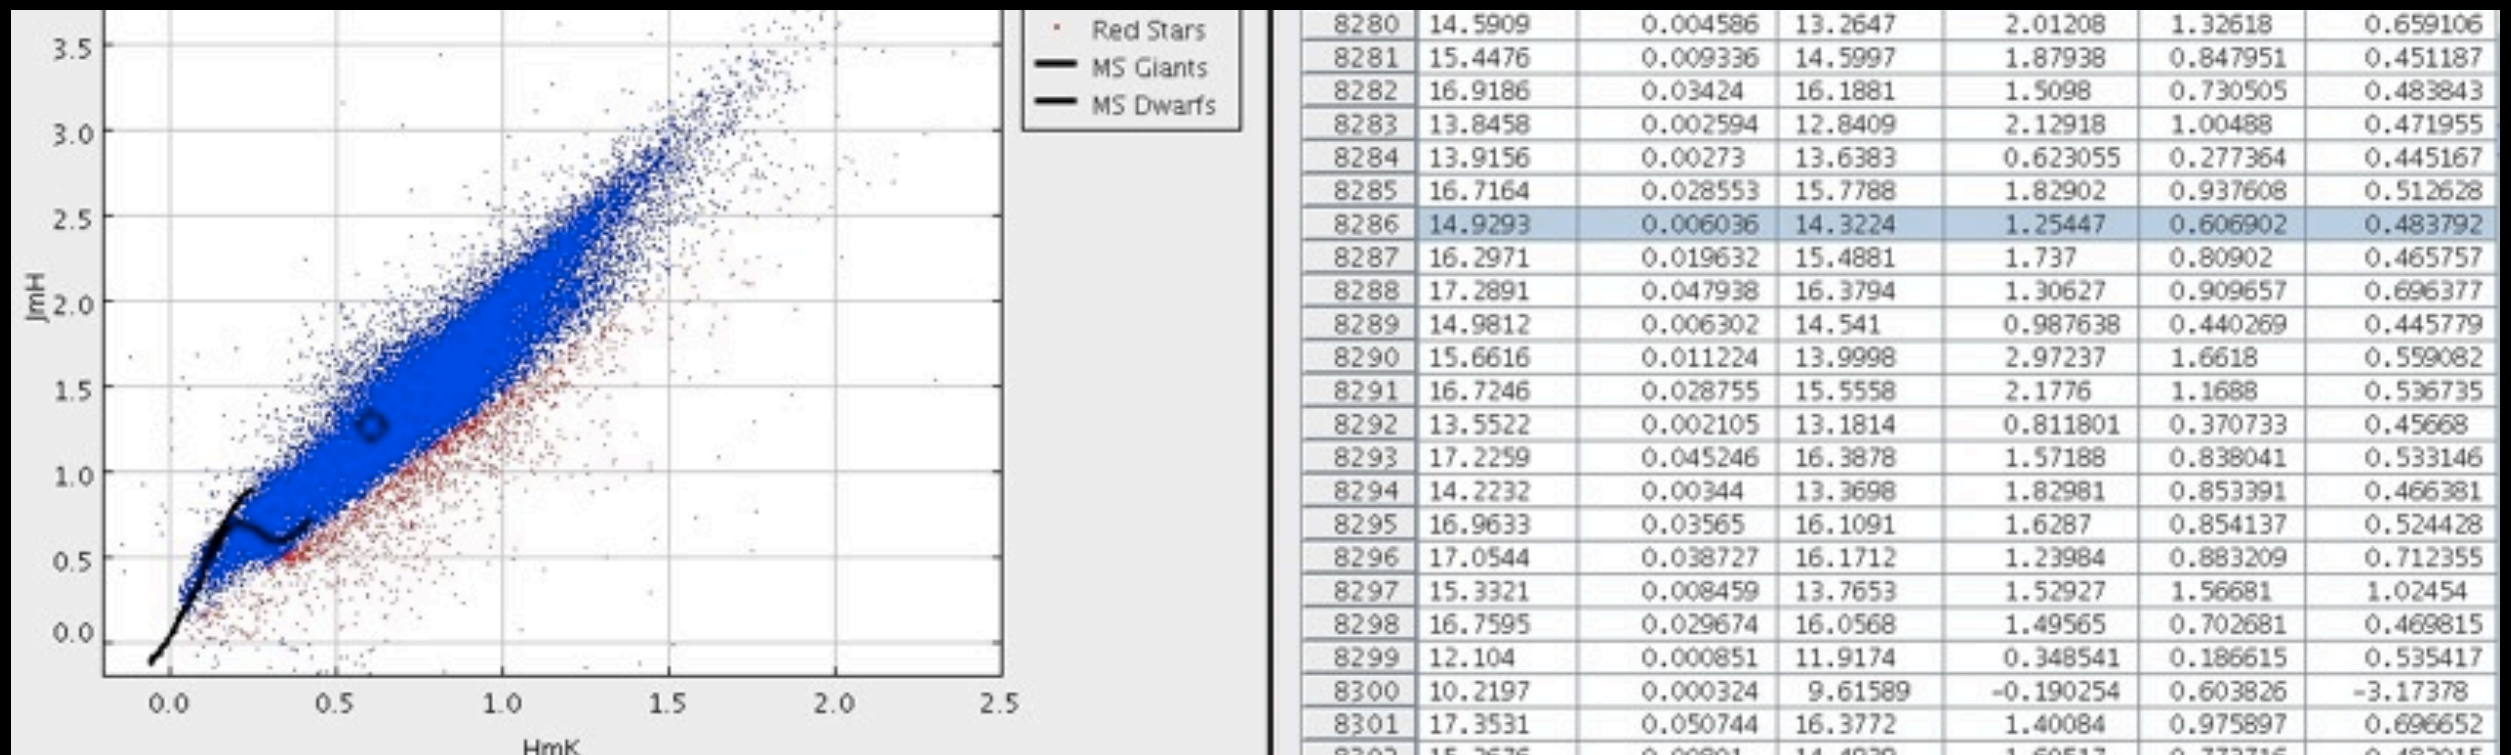

← 200 arcsec / 6200 pix →

There are many fields with a lot of observations...

- GOODS North & HDFN
- GOODS South & CDFS
- Lockman Hole
- Extended Groth Strip
- XMM-LSS
- ELAIS N1, N2, S1
- First Look Survey
- Bootes (NOAO Deep Wide)
- VVDS
- ...and many more...

Astronomy In The Internet Age

Astronomy Trends

CMB Surveys (pixels)

- 1990 COBE 1,000
- 2000 Boomerang 10,000
- 2003 WMAP 1M
- 2009 Planck 10M

Angular Galaxy Surveys (obj)

- 1970 Lick 1M
- 1990 APM 2M
- 2005 SDSS 200M
- 2009 PanStarrs 1200M
- 2015 LSST 3000M

Galaxy Redshift Sources (obj)

- 1986 CfA 3,500
- 1996 LCRS 23,000
- 2003 2dF 250,000
- 2005 SDSS 750,000

Astronomy data

- 1 pixel (byte) per sq arc second -> 4 TB to cover the whole sky
- Multi wavelength, different epochs, different depths, ... -> 1 PB
- Data doubles every 2 years

What is a Petabyte

- A Petabyte is a lot of data (10^{15} bytes)
- 1PB 13.3 years of HD video
- 50PB is the entire written works of mankind from the beginning of recorded history in all languages
- Get ready for the next revolution: Exabytes (10^{18}), Zettabytes (10^{21}) and Yotabytes (10^{24})

Some future facilities

- PanStarrs 1 (1.8m) produces in 1PB / year. 80TB database server (largest astronomy database in the world)
- PanStarrs 4 (2012) will generate 4 PB/year
- LSST (2015) is a 8.4m telescope which will produce 30TB per night
- SKA (2020) 1EB / day (i.e. more data in 6 hours than all radio astronomy ever)

Astronomy data

- 1 pixel (byte) per sq arc second -> 4 TB to cover the whole sky
- Multi wavelength, different epochs, different depths, ... -> 1 PB
- Data doubles every 2 years
- Discoveries are done in the boundaries, need to cross match different wavelengths

The multiwavelength Crab Nebula

http://coolcosmos.ipac.caltech.edu/cosmic_classroom/multiwavelength_astronomy/multiwavelength_museum/m1.html

http://imagine.gsfc.nasa.gov/docs/science/know_12/multiwavelength.html

Need for databases

- Traditional data search and transfer are not adequate
- You can do a grep of 1TB in 2 days, transfer it by internet in 2 days for 1K\$
- You can do a grep of 1PB in 3 years, transfer it by internet in 3 years for 1M\$
- Need indices to limit search, parallel data search, i.e. databases
- Do not move the data, do all data manipulations at the database

Sloan Digital Sky Survey / SkyServer

- Finding Chart
- Download
- Projects
- DR7
- DAS
- Site Search
- Help

Welcome to the **DR7 Catalog Archive Server** site providing public access to SDSS data for professional astronomers.

The following databases are available	
BestDR7	[Default] The best version photo (imaging), spectro and tiling data
TargDR7	The version of the data from which spectroscopic targets were chosen

News

This site contains data from **Data Release 7 (DR7)**. Please see the **Site News** page, **What's New in DR7** page and the **Known Problems** page for more information.

To run a query on one of the DR7 DBs other than BESTDR7, name the database explicitly in the query:

```
SELECT TOP 100 * FROM TARGDR7..PhotoObj
WHERE r<17 and r-i>2
```

CasJobs: Advanced Search using SQL

The image shows the SDSS Query / CasJobs web interface. At the top, there is a navigation bar with links: Help, Tools, Query, History, MyDB, Import, Groups, Output, Profile, Queues, SkyServer, Logout, and eddie0uk. Below this is a header area with the text "SDSS Query / CasJobs" and a background image of a star field. The main interface is divided into several sections:

- Context:** A dropdown menu showing "DR7", a text input field for "Table (optional)" containing "MyTable", and a text input field for "Task Name" containing "My Query".
- Query Execution:** A row of buttons: "Samples", "Recent", "Clear", "Line 1, Col 1 [2 s]", "Query complete!" (in green), "Syntax", "Plan", "Quick", and "Submit".
- SQL Query:** A text area containing the following SQL query:

```
SELECT TOP 100 s.objid,s.ra,s.dec,u.modelmag_r as umagr, s.modelmag_r as smagr
FROM PhotoPrimary s
JOIN Ubercal u on (s.objID=u.objID)
WHERE
  ra BETWEEN 257 and 262 AND dec BETWEEN 58.2 and 60.8
  AND s.objID=u.objID AND u.calibStatus_r & dbo.fUberCalibStatus('PHOTOMETRIC') > 0
```
- Results:** A section titled "100 row(s)" displaying a table with 5 columns: objid, ra, dec, umagr, and smagr. The first few rows of data are shown.
- Output Options:** A row of buttons: "Plot", "Save As", "HTML" (with a dropdown arrow), "Query", "Results", and "Both".

CasJobs: Advanced Search using SQL

No. 1

Reference Code : [1996MNRAS.278.1049R](#)
 Freq. targeted : EO IPC (0.1-4.5 keV)
 Measurement : 45.69 nJy = 4.57E-34 W m⁻² Hz⁻¹
 Uncertainty : nJy = 0.00E+00
 Significance : no uncertainty reported
 Freq or Vel. : 1.6 keV (OBS) = 3.87E+17 Hz
 Frequency mode : Broad-band measurement; broad-band flux derived by integration over spectrum; synthetic band
 Coord. targeted: 153457.22 +233011.40 (J2000)
 Spatial mode : Integrated from scans
 Notes : Homogenized from previously published data
 Qualifiers :

No. 2

Reference Code : [1991RC3.9.C...0000d](#)
 Freq. targeted : U (U_T)
 Measurement : 14.27 mag = 3.55E-29 W m⁻² Hz⁻¹
 Uncertainty : 0.15 mag = 5.09E-30
 Significance : rms uncertainty
 Freq or Vel. : 3660 A (OBS) = 8.19E+14 Hz
 Frequency mode : Broad-band measurement
 Coord. targeted: 153247.3 +234006 (B1950)
 Spatial mode : From multi-aperture data
 Notes : Homogenized from new and previously published data; Standard Johnson UBVRI filters assumed
 Qualifiers :

- Find and search published catalogues
- Coverage, documentation

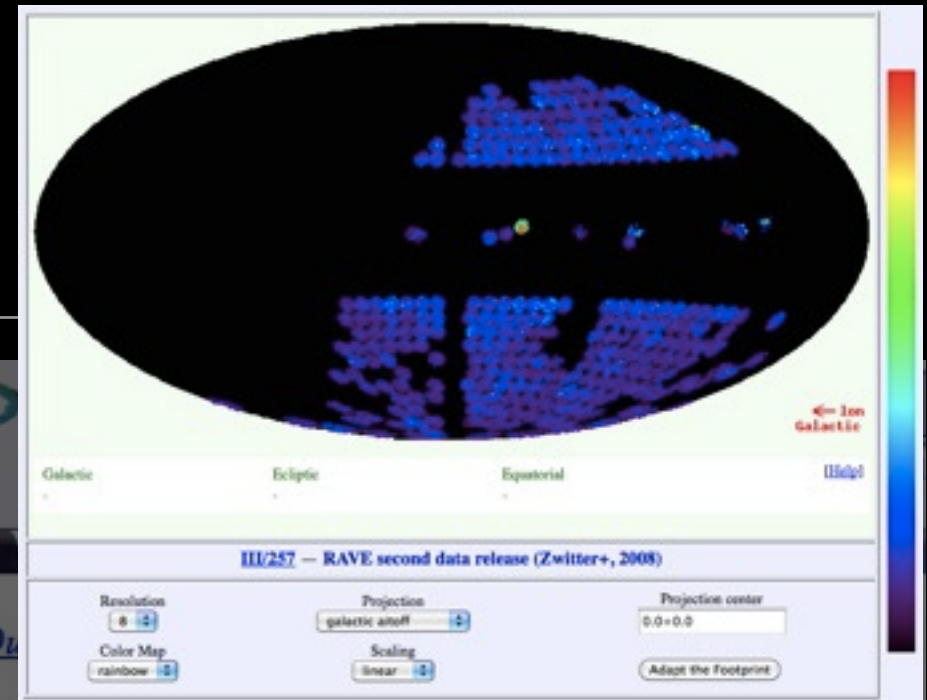

The screenshot shows the VizieR Service interface with the following elements:

- Navigation Bar:** Includes logos for CDS (Centre de Données Astronomiques de Strasbourg), Simbad, VizieR, Aladin, Catalogs, Dictionary, and Bibliography.
- Service Title:** "VizieR Service"
- Links:** "Browsing through Catalogues · Output Preferences", "FAQ · More about VizieR"
- Search Section:**
 - "Direct access to Catalogues from Name or Designation (tips and examples)" with a "Find Catalogue" button.
 - "Find catalogues or Data (tips and examples)" with a "Find catalogues among 7658 available" label and a "Find Catalogues" button.
 - Input field: "Words matching author's name, word(s) from title, description, etc."
 - Filter section: "Select from Wavelength, Mission, and controlled Astronomical keywords:" with three columns of keywords (e.g., Radio, IR, optical, UV, EUV, X-ray, Gamma-ray; ANS, ASCA, BeppoSAX, CGRO, COBE, Chandra, CoRoT; AGN, Abundances, Ages, Associations, Atomic_Data, BL_Lac_objects, Binaries:cataclysmic).
 - Options: "Select from UCDs" (checkbox), "Use LISTS of Targets" (checkbox), "Show footprints" (checkbox), "Show all columns" (checkbox), "Show column UCDs" (checkbox).
 - Buttons: "Clear", "Find Data around Target".
- Position Search Section:**
 - "Search by Position across 7909 tables"
 - Input: "Target Name (resolved by Simbad) or Position:" with a "J2000" dropdown.
 - Input: "Target radius:" with a value of "2" and "arcmin" dropdown.
 - Options: "Position in" (radio buttons for Sexagesimal, Decimal), "Radius or" (radio buttons for Radius, Box size).
 - Buttons: "Clear", "Find Data around Target".
- Output Preferences Section:**
 - "Output preferences (usage)"
 - Maximum Entries per table: "50" (dropdown)
 - Output layout: "HTML Table" (dropdown)
 - ALL columns: checkbox
 - Buttons: "Reset All"
- Table Headers and Sort Options:**

	r	x,y	PositionGalactic	J2000	B1950	EclJ2000	none
Compute	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Sort by	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
- Footnote:** "r and x,y are the distance to the Target; Position is in the same coordinate system as Target."

Many more data services

- IRSA
- MAST
- WSA
- Telescope Archives: ING, ESO, CFHT, NOAJ,
- **Lots of data already available to download from the Internet**

The Virtual Observatory

The Virtual Observatory

- Premise: most data is (or could be) online
- So the Internet is the world's best telescope
 - It has data on every part of the sky
 - In many spectral bands: optical, radio, x-ray, ...
 - As deep as the best instruments (2 years ago)
 - It is up when you are up. Seeing is always great, no working at night, ...
 - It is a smart telescope: links objects and data to literature on them.

Slide from A. Szalay

The Virtual Observatory

- Data distribution is not homogeneous at the moment: different archives, different data formats, data description, tools to interact, ...
- IVOA: International Virtual Observatory Alliance (about 20 countries and growing up)
- Provide content (data, metadata) services, standards, analysis services
- Federate existing and forthcoming large sky surveys and archives, facilitate data distribution
- Develop and provide data exploration and discovery tools

The Virtual Observatory

- Need for new data mining techniques, data understanding technologies, hyperdimensional visualisation, machine assisted discovery, ...
- Facilitate science with massive data sets
- Optimise use of expensive resources (e.g. space missions)
- Enable and stimulate new science

Tools : Image Visualization with Aladin

- Search and view images
- Display footprints
- Display Catalogues
- Measure quantities
- VO Tools share standards and are interoperable

The screenshot displays the Aladin v6.0 software interface. The main window shows a star field with several overlaid footprints (red and blue). The interface includes a menu bar (File, Edit, Image, Catalog, Overlay, Tool, View, Interop, Help), a location input field (00:42:04.20 +41:11:41.0), and a pixel size dropdown (unknown). A toolbar on the right contains various tools like select, pan, zoom, dist, draw, tag, text, filter, cross, rgb, and assoc. A layer control panel on the right shows checked layers for Filter2, Tycho-2, HST, F606W, Mosaic, F606Wa, F606Wb, F606Wc, RGB img, and GaleX FU. A zoom control is set to 1/2x. A search bar is located at the bottom right. At the bottom, a catalog table is visible with columns for TYC1, TYC2, T, pmRA, pmDE, BTmag, VTmag, HIP, RA (ICRS), and DE (ICRS).

TYC1	TYC2	T	pmRA	pmDE	BTmag	VTmag	HIP	RA (ICRS)	DE (ICRS)
2801	1169	1	7.8	-4.2	12.375	11.865		11.80523889	40.83714611

Tools : Image Visualization with Aladin

- Search and view images
- Display footprints
- Display Catalogues
- Measure quantities
- VO Tools share standards and are interoperable

The screenshot displays the Aladin v3.0 multiview software interface. The main window is titled "Aladin v3.0 multiview" and features a menu bar with "Load...", "Save...", "Tools...", "Print...", "Help...", and "Quit". Below the menu bar, the "Position" is set to "J2000" with coordinates "18:02:13.65 -23:01:02.4". The "Pixel" size is "full" and the zoom level is "0.7594".

The interface is divided into several sections:

- Top Left:** A panel showing a color image of the Trifid nebula with a green circle and a yellow arrow pointing to a specific feature.
- Top Right:** A panel labeled ".SERC.S.MAMA.521" showing a grayscale image of the same region with a green circle and a yellow arrow.
- Bottom Left:** A panel labeled ".SERC.I.MAMA.521" showing another grayscale image with a green circle and a yellow arrow.
- Bottom Right:** A panel labeled ".SERC.V.DSS1.521" showing a grayscale image with a green circle and a yellow arrow.

On the right side, there is a toolbar with various icons for selection, distance measurement, drawing, tagging, text, filtering, color selection, blinking, ramping, contouring, zooming, magnifying glass, histogram, plot, and deletion. Below the toolbar is a list of layers and filters, including "Trifid nebula", "Drawing 1", "Circ.Mag", "HST", "USNO-B1", "RGB img", "SERC.S.MAN", "SERC.I.MAM", and "SERC.V.DSS".

At the bottom, there is a data table for the selected view:

[View B1] - SERC.S.MAMA.521 - Provided by CDS Aladin image server

▷ 0669-0683137	270.586123	-23.039303	1964.9	0	0	2	9.84					10.99	0	0

▷ 0669-0683140	270.598778	-23.029200	2000.0	-6	-2	0	10.53	11.48	11.12	11.50	11.71	0	0	

At the bottom of the window, there is a footer with the text "(c)1999-2005 ULP/CNRS - Centre de Données astronomiques de Strasbourg" and "8 planes, 4 views, 30Mb".

Challenges

- **Large amounts of data** - Need of databases, efficient search. Move analysis to the data
- **Make efficient use of existing data from archives** - every part of sky has been observed at least once, many areas with multiwavelength coverage
- **Data exploration** - an emerging new branch of science - computational methods, algorithm thinking, visualisation, new HPC architectures

The End
